

Statistical methods in genetics and chemometrics

Prof. Dr. Jörg Rahnenführer, Room 720

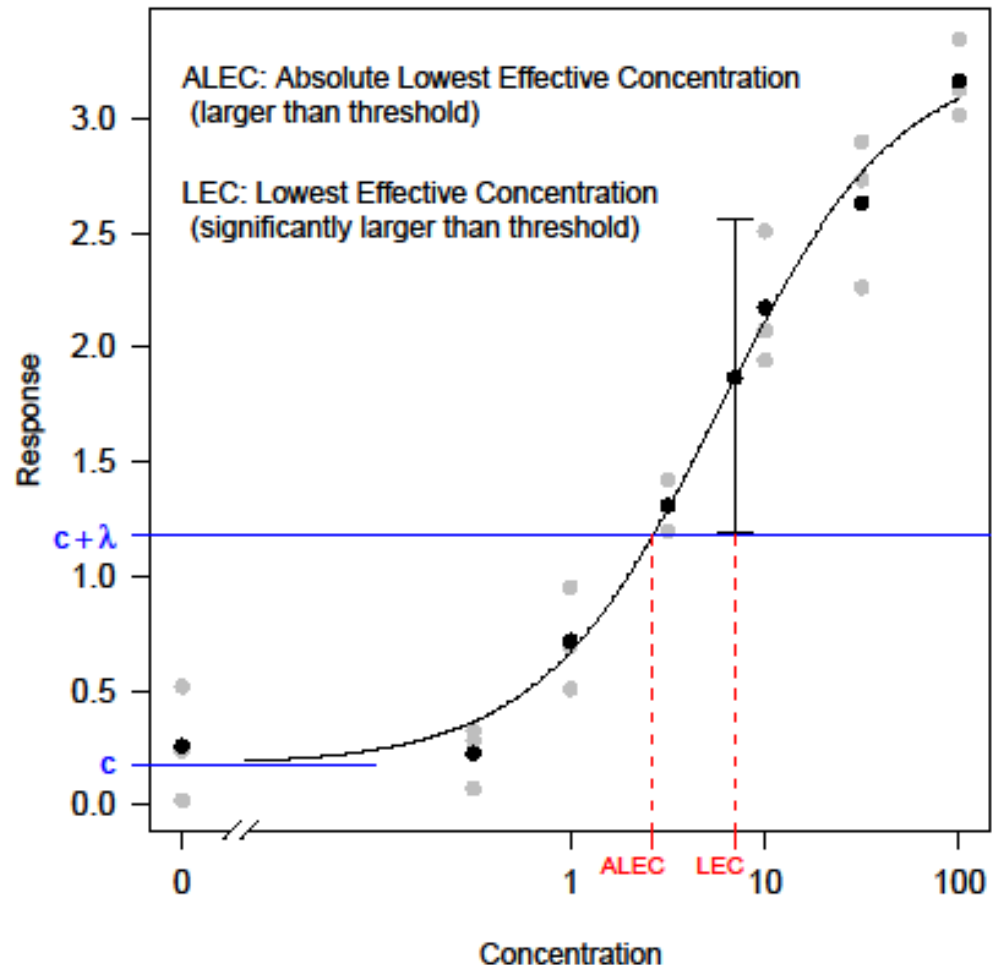

Email: rahnenuuehrer@statistik.tu-dortmund.de

Lectures

- [Statistics in toxicology II \(testing\)](#) (WiSe 2021/22)
 - Friday 9-12, online or in M/E 21
- [Statistical methods in genetics \(bioinformatics\)](#) (WiSe 2021/22)
 - Tuesday 8-10 and Thursday 12-14, online or in M/E 21

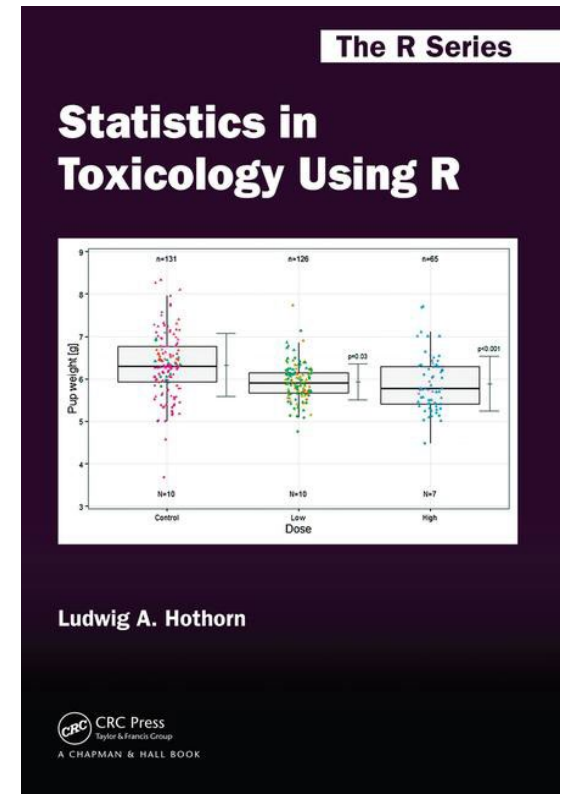

Statistics in toxicology I: Topics

- Modeling of relationships between dose and response
 - Parametric models
 - Model selection, model averaging
- Estimation of alert concentrations from
 - genetic data (gene expression)
 - classical assays (cytotoxicity)

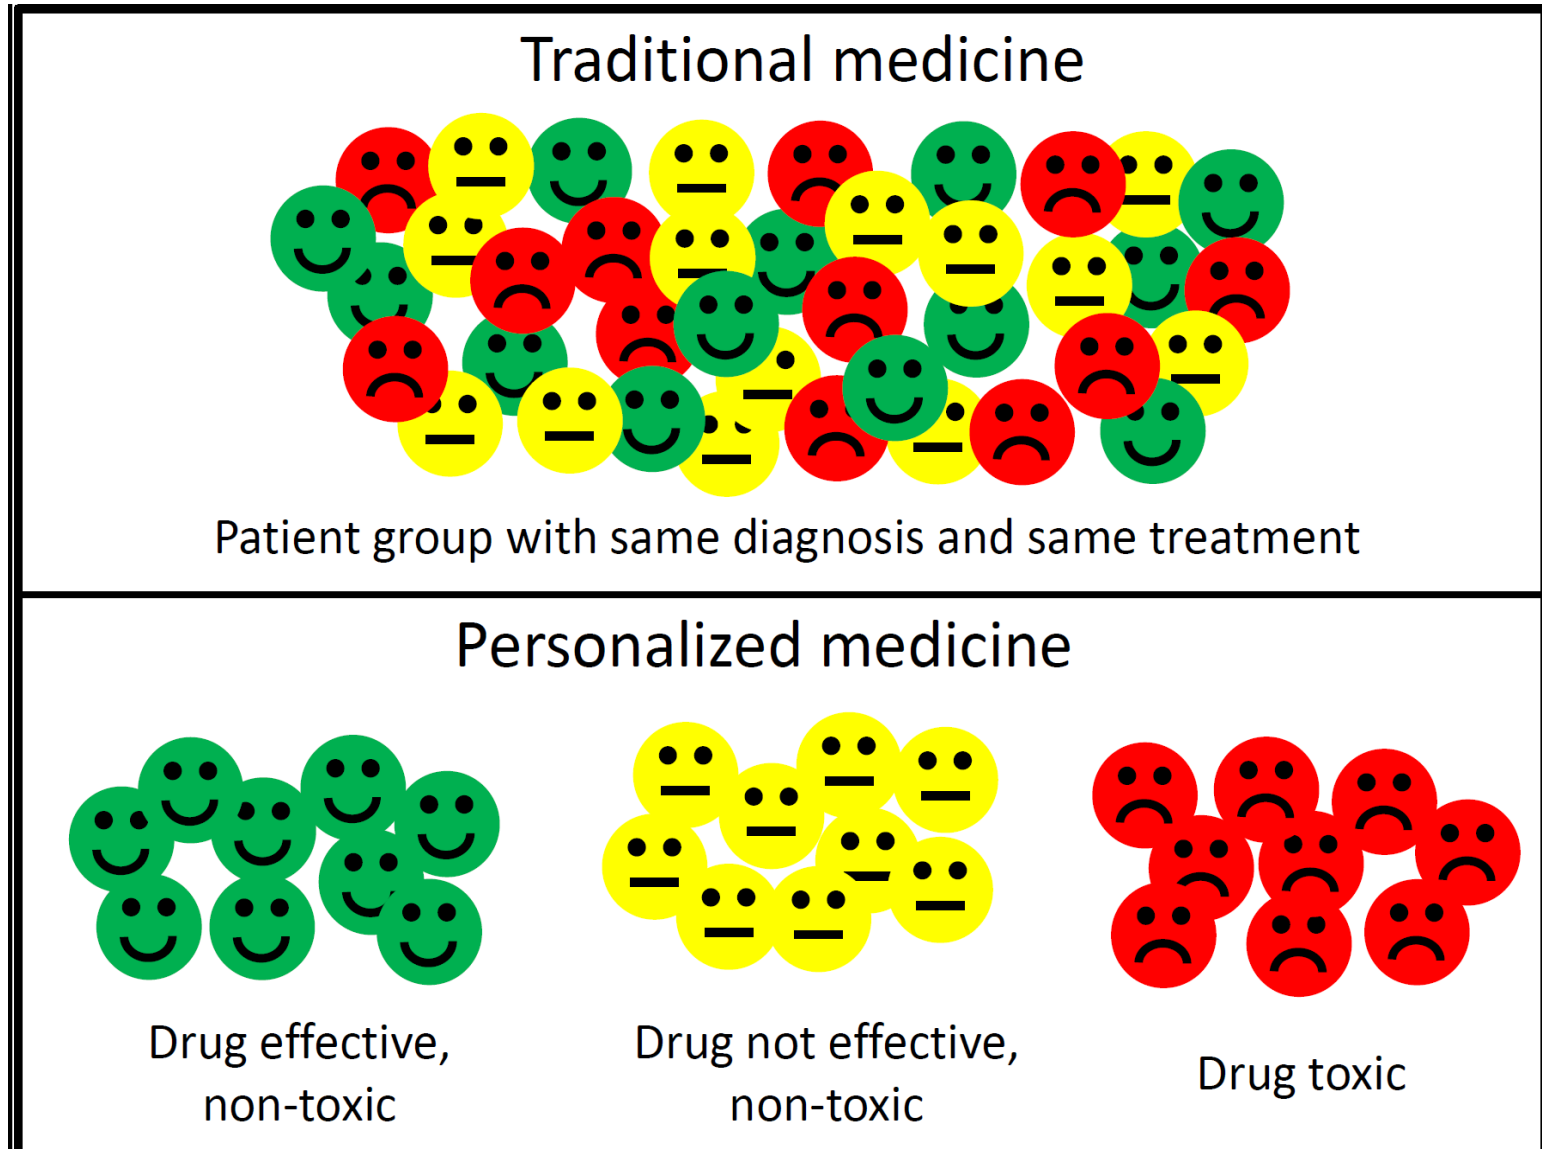

Statistics in toxicology II: Topics

- **Proof of hazard using multiple comparisons with negative control**
 - Multiple testing
 - Tests for normally distributed endpoints and for proportions
- **Trend tests**
 - Analysis of long-term effects in cancer studies
 - Survival analysis, tests for survival endpoint
- **Analysis of effects in mutagenicity assays**
 - Mixture distributions, EM algorithm
- **Dose-finding in Phase I clinical trials**

Statistical methods in genetics (bioinformatics)

Statistics in genetics (bioinformatics): Topics

- **Sequence analysis**
 - Sequence modeling: Markov chains and Markov processes
 - Sequence alignments, phylogeny
- **Analysis of omics data (expression data)**
 - Preprocessing, normalization
 - Classification (cluster analysis, discriminant analysis, ...)
 - Finding "active" genes, variable selection
 - Biological interpretation (combination of different data types, networks, toxicology...)
 - Time series
- **Disease progression**
- **Proteomics**
